

MASTER JAVASCRIPT OBJECTS

Your Ultimate JavaScript Object Cheatsheet

Don't forget to save it 

1

Creating Objects

```
// Object literal syntax
const person = {
  name: "John",
  age: 30,
  gender: "male",
};

// Constructor function
function Person(name, age, gender) {
  this.name = name;
  this.age = age;
  this.gender = gender;
}

const person = new Person("John", 30, "male");
```

An object is a built-in data type for storing key-value pairs.

Data inside objects are unordered, and the values can be of any type.

2

Accessing Object Properties

```
const person = {  
  name: "John",  
  age: 30,  
  gender: "male",  
};  
  
// Dot notation  
console.log(person.name); // Output: "John"  
  
// Bracket notation  
console.log(person["age"]); // Output: 30
```

When trying to access a JavaScript object property that has not been defined yet, the value of undefined will be returned by default.

3

Adding or Modifying Properties

```
const person = {  
  name: "John",  
  age: 30,  
  gender: "male",  
};  
  
person.city = "New York"; // Add new property  
person.age = 31; // Modify existing property
```

4

Removing Properties

```
delete person.gender; // Remove property
```

5 Object Methods

```
const person = {  
  name: "John",  
  age: 30,  
  gender: "male",  
  greet: function() {  
    console.log(`Hi, my name is ${this.name}`);  
  }  
};  
  
person.greet(); // Output: "Hi, my name is John"
```

6 Cheaking if a property exists

```
if('name' in person) {  
  console.log('Name Exists!');  
}
```

7

Looping Through Object Properties

```
const person = {  
  name: "John",  
  age: 30,  
  gender: "male",  
};  
  
// For...in loop  
for (let prop in person) {  
  console.log(`${prop}: ${person[prop]}`);  
}  
  
// Object.keys() method  
Object.keys(person).forEach((prop) => {  
  console.log(`${prop}: ${person[prop]}`);  
});
```

8

Object Serialization (JSON)

```
// Creating an object
```

```
const person = {  
  name: "John",  
  age: 30,  
  gender: "male",  
};
```

In the code above, we first create an object called person with three properties.

```
// Serializing object to JSON string
```

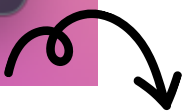

```
const json = JSON.stringify(person);
```

```
console.log(json); // Output: {"name":"John","age":30,"gender":"male"}
```

```
// Parsing JSON string to object
```

```
const obj = JSON.parse(json);
```

```
console.log(obj); // Output: { name: 'John', age: 30, gender: 'male' }
```

Then, we use the `JSON.stringify()` method to serialize the object into a JSON string and store it in the `json` variable.

Finally, we use the `JSON.parse()` method to parse the JSON string back into an object and store it in the `obj` variable.

Is It Informative and Helpful ?
